Simple train station configurations

От HjarraKass

Just simple train station builds to make your life easier :)

Uses only 2 types of signals: Paths signal and block signal

Ro-Ro stations can handle high amounts of traffic. I tend to run 40+ trains on my railways and have no issues with stations.

Terminus stations can't handle that much and I only use them for a couple of trains.

*Ro-Ro stands for roll-on roll-off, meaning trains come in one way and exit the other.

Straight Ro-Ro station

Curved Ro-Ro station

2-lane terminus station

4-lane terminus station

They can be extended lane wise until game limits by extending the middle cross further away from the station.

Can you show some more screenshots? How do you connect your stations to your main rail network?

Excellent guide! I'd rate it up if I didn't have a VAC ban 🚫

@kLuns you, you're actually right and wrong... terminus stations can be done a lil better , your example isnt it though.

I like the look of your curved ro-ro... does it have any better through-put than the strait ro-ro? (even a minute difference is a difference)

I always put down a 2-3 station blocks at 5 to 7 lengths each (sort of like a curved ro-ro but more compact and doubles back on itself). and then run some rails out the back and around to the side of one of the station blocks, and run a double or triple line with the outgoing line containing the double line if and when needed.

Incoming trains go along a single rail connected to the blocks with a depot close by. I tend to stay away from the last two designs because they bottle neck easily and you want you trains coming and going as fast as possible.
